

Dietary transition and contaminants in the Arctic: emphasis on Greenland

CHS is an independent publication series and publishes a wide variety of material in the field of circumpolar health and wellbeing. It is intended that the produced material is of considerable value for health care professionals and officials in circumpolar areas, or may otherwise be useful for health care development and practices in the circumpolar areas. It is planned, and depending on our clients and collaborators needs, that we will publish a varying amount of supplements annually.

This issue of the CHS provides information of the dietary transition and contaminants in the arctic with a special emphasis on Greenland. The material demonstrates the history and changes in dietary habits in Greenland. The present status of contaminants and their potential interrelations with metabolic disorders is also showcased. The review is concentrated on a possible aggravating effect of pollutants on lifestyle-related metabolic disorders.
